New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

Claim 1; SEQ ID NO 2; 164pp; French.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with

ö
             these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF1R and/or EGFR. This sequence represents an CDR sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Insulin-like growth factor 1 receptor; antibody; tumor; cytostatic; neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder.

```

The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of

```
comprising a light or heavy chain having at least one complementary comprising a light or heavy chain having at least one complementary controlled and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment coff at liness connected with an antibody of the invention or treatment coff an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or connected with a cativation of the ransduction pathway of the signal mediated by the interaction of IGF or IGF2 with IGF-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly induces secondary effects connected with inhibition of the insulin contractor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of not HERZ/neu-dependent and/or EGF-dependent, especially IGF1 and/or IGF2-dependent and/or EGF-dependent and/or EGF-dependent calls. (I) is useful in the preparation of a medicament calls. (I) is useful in the preparation of a medicament intended for prevention or for the preparation of a medicament intended for prevention or for the preparation of a medicament intended for prevention or for the preparation of a medicament intended for prevention or for the preparation of a medicament intended for the specific targeting of an endicament intended for the specific targeting of a medicament intended for the specific targeting or a biologically active compound to the standfor EGF readment of provided semple in which the abnormal presence, of IGF-IR and/or IGF-IR and/or IGF-IR and/or EGF reaceptor is suspected, which involves concaring th

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (IGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit craneformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and passiste, lung, breast, and one to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytostatic; antipsoriatic; antibody; insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region; CDR.

                                           The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (II) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transition of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating portaging. Ab are also used to diagnose diseases caused also for treating portaging. Ab are also used to diagnose diseases caused also man also on the contraging and also entomed the property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region;
                                                                                                                                                                                                                                                                                              by abnormal expression of IGF-1R and/or EGFR. This sequence represents a

treat diseases associated with overexpression and/or abnormal activity of IGF-1R and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Sepecially they inhibit transformation of normal calls to tumor calls, inhibit growth and/or proliferation of tumor calls, so are useful against cancers of the proliferation of tumor calls, so are useful against cancers of the also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.
tinase activity of IGF-1R. Ab and its fragments are used to prevent or

useful for treating cancer.

The invention relates to a novel isolated anti-insulin-like grow'n ractor or peable of states to a novel isolated anti-insulin-like grow'n ractor capable of binding to human IGF-IR and, if necessary, capable of apable of specifically inhibiting to human igF-IR and, if necessary, capable of apable of specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary comprising a light or heavy chain having at least one complementary cardeterming region (CDR) consisting of one of two fully defined is amino acids (ADZ67006 and ADZ67014). An antibody of the prevention or treatment of an edicament intended for the prevention of the IGF-IR and/or connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGF, and/or connected with a cativation of the IGF-IR and/or EGF, and/or connected with cativation of the IGF-IR and/or EGF, with IGF-IR and/or of EGF with EGF, where the administration of the medicament does not induce or only slightly induces accondary effects connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to IGF-IR and/or IREZ/reu-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or IREZ/reu-dependent and/or IREZ/reu-dependent calls. (I) is useful in the preparation of a medicament intended for prevention or two the treatment of cancer, where cand-or the specifies and prostate cancer, osteosarcoma, lung cancer, che cancer; endometrial cancer or colon cancer. (I) is useful in preparation of a medicament intended for the prevention of a medicament intended for prevention or two the present or preparation of a medicament intended for the presention of a medicament intended for the specified and/or EGF receptor. (I) is useful in the expensing or overexpressing the IGF-IR and/or EGFR receptor. (I) is useful in which the abnormal presence of IGF-IR and/or EGFR receptor is useful in the exemplification of the invention. (E biological sam invention relates to a novel isolated anti-insulin-like growth factor

Beck A; Haeuw J, Duflos A, Leger O, Corvaia N, Goetsch L,

WPI; 2005-321968/33. N-PSDB; ADZ67066 Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer

Example 12; SEQ ID NO 61; 125pp; English.

The invention relates to a novel isolated anti-insulin-like growth factor
I receptor (IGF-IR) antibody (I) or its functional fragment, being
capable of binding to human IGF-IR and, if necessary, capable of
specifically inhibiting tyrosine kinses activity of the receptor,
comprising a light or heavy chain having at least one complementary
determining region (CDR) consisting of one of two fully defined 16 amino
acids (ADE5/006 and AD55/016). An antibody of the invention is useful in
the preparation of a medicament intended for the prevention or treatment
of an illness connected with an overexpression and/or an abnormal
cof an illness connected with an overexpression and/or an abnormal
cof activation of the IGF-IR and/or EGFR, and/or connected with a
the administration of the medicament does not induce or only alightly
induces secondary effects connected with inhibition of the insulin
receptor. The antibody is useful for preparation of a medicament intended
to inhibit the transformation of normal cells into cells with tumoral

us-10-735-916a-2.rag

character, preferably IGF-dependent, especially IGF1 and/or IGF2dependent and/or EGF-dependent and/or HER2/neu-dependent cells. (I) is
useful for preparation of a medicament intended to inhibit the growth
and/or the proliferation of tumor cells, preferably IGF-dependent,
especially IGF1-and/or IGF2-dependent and/or EGF-dependent and/or EGF-dependent cells. (I) is useful in the preparation of a
medicament intended for provention or for the treatment of cancer, where
the cancer is chosen from prostate cancer, osteosarcoma, lung cancer,
breast cancer, endometrial cancer or colon cancer. (I) is useful in the
treatment of psoriasis. (I) is useful in preparation of a medicament
intended for the specific targeting of a biologically active compound to
cells expressing or overexpressing the IGF-IR and/or EGFR receptor.
Coverexpression or an underexpression of illnesses induced by an
overexpression or an underexpression of the IGF-IR and/or EGFR receptor
starting from a biological sample in which the abnormal presence, of IGFIR and/or EGFR receptor is suspected, which involves contacting the
biological sample with (I), which is optionally labeled. The present \$

This invention describes a novel method for treating a neoplasm that expresses and/or binds interleukin-13 (IL-13). The method comprises administering an anti-IL-13 antibody or its binding fragment that binds of peotifically and with high affinity to both glycosylated and non-gpeotifically and with high affinity to both glycosylated and non-gproximate molar ratio of 1:2 (MAD:IL-13). The method also describes 1) a method for treating Hodgxin's disease comprising administering a numbit of the biological activity of binding fragment to a patient; also decrease activity of IL-13 and 3) disagnosing a cancer or tumor overexpressing IL-13 comprising the use of the anti-IL-13 antibody to detect overexpressing IL-13 comprising the use of the anti-IL-13 antibody to detect overexpressing of IL-13 in the biological sample taken from a patient suspected of having the cancer or tumor. The antibods used in patient suspected of having the cancer or tumor. The antibody to the invention are 2288/C produced by the hybridoma designated PTA-5657, 228A-4 and produced by the hybridoma designated PTA-5655. The antibody is a human antibody, a chimeric antibody, a single domain antibody or a humanized antibody, a chimeric antibody, a single domain antibody or a humanized antibody in the antibody further comprises a physiologically acceptable carrier, diluent, excipient, or stabilizer. The antibody mediates killing carrier, diluent, excipient, or stabilizer. The antibody mediates within region comprises at least a variable; FRL1-chain region comprises a constant region. The variable ight or heavy chain region further comprises at least a variable; from an igd antibody. The natibody is an igd; igd; igd; or an igd antibody is an igd; antibody with a cycloxic agent. Energies the heavy of chain and igd antibody is an igd antibody with a cycloxic agency and a region further comprises a constant region. The variable is a red of the constant region is a red of seque

New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

Disclosure; SEQ ID NO 49; 164pp; French

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells, so are useful against cancers of the proliferation of tumor cells, on are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteessarcoma, and also for treating psoriagis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-1R and/or EGFR. This sequence represents a protein sequence used to generate the Ab of the invention.

WPI; 2005-321968/33. N-PSDB; ADZ67052 Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer.

Example 8; SEQ ID NO 49; 125pp; English.

The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal caturaction of the IGF-IR and/or EGFR, and/or connected with a hyperactivation of the transduction pathway of the signal mediated by the interaction of IGF1 or IGF2 with IGF-IR and/or of EGF with EGFR, where the administration of the medicament does not induce or only slightly receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells with tumoral to inhibit the transformation or norman cerse character, preferably IGF-dependent, especially IGF1 and/or IGF2.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGP-IR) and optionally; (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine

New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulan-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulan-like growth factors (IGP-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Bspecially they inhibit transformation of normal cells, to are useful against cancers of the
kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells, to use cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate. Jung, breast, endometrium and colon, also osteosarcom, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; EGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.
                                                                                                                                                                                                                                                                                                   Gaps

useful for treating cancer.

Example 12; SEQ ID NO 67; 125pp; English.

The invention relates to a novel isolated anti-insulin-like growth factor

The invention relates to a novel isolated and initialin-like growin ractor or receptor (IGP-IR) antibody (I) or its functional fragment, being growin capable of capable of binding to human IGF-IR and, if necessary, capable of apable of binding to human IGF-IR and, if necessary, capable of opecifically inhibiting tytosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary capable of determining region (CDR) consisting of one of two fully defined is amino acids (ADZ67006 and ADZ67014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF-IR and/or EGFR, and/or connected with a culture or only slightly interaction of IGF or IR and/or EGFR, and/or connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended connected with inhibition of the insulin receptor. The antibody is useful for preparation of a medicament intended to inhibit the growth and/or EGF dependent and/or EGF dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent and/or IGF2-dependent calls. (I) is useful in the preparation of a medicament intended for prevention or for the treatment of cancer is chosen from prostate cancer, osteosarcoma, lung cancer, because andomeral andomerappearation of a medicament intended for prevention or for the preparation of a medicament intended for prevention or colon cancer. (I) is useful in the preparation of a medicament intended for the preparation of a medicament intended for the prevention or colon cancer. (I) is useful in the cancer is chosen from prostate cancer, osteosarcoma, lung cancer. Colon cancer intended for the specific targeting the IGF-IR and/or EGFR receptor. It and/or EGFR receptor is useful in whi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ; Sequence 30, Application US/08129930B
; Patent No. 3604167
; GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: do Couto Dr., Fernando J.R.
APPLICANT: Peterson Dr., Roberto L.
APPLICANT: Padlan Dr., Eduardo A.
ITILE OF INVENTION: Analogue Peptides With Broad
TITLE OF INVENTION: Analogue Peptides, and Kit and
TITLE OF INVENTION: Diagnostic Vaccination and
TITLE OF INVENTION: Therapeutic Methods
NUMBER OF SEQUENCES: 96
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    96.3%; Score 78; DB 1; Length 16; 93.8%; Pred. Application US/08976288A

Patent No. 6315997

GENERAL INPORMATION:

APPLICANT: Ceriani Dr., Fernando J.R.

APPLICANT: Peterson Dr., Jerry A.

APPLICANT: Peterson Dr., Jerry A.

APPLICANT: Peterson Dr., Bduardo A.

TITLE OF INVENTION: Analogue Peptides With Broad

TITLE OF INVENTION: Diagnostic Vaccination and

TITLE OF INVENTION: Therapeutic Methods

NUMBER OF SEQUENCES: 96

CORRESPONDENCE ADDRESS:

ADDRESSEE: Petetry, Schroeder & Poplawski

STREET: 444 South Flower St., 19th Floor
                                                                                                                                                                                                                                                                                           DB 2; Length 16;
                                                                                                                                                                                                                                                                                                                                      0; Indels

Sequence 30, Application US/09947839B

Patent No. 6936706

GENERAL INPORMATION:
APPLICANT: do Couto, Fernando J.R.
Ceriani Dr., Roberto L.
Peterson Dr., Jerry A.
Padlan Dr., Eduardo A.
TITLE OF INVENTION: Analogue Peptides with Specificity
for Carcinomas and Kit and Diagnostic Vaccination and Therapeutic Methods.
                                                                                                                                                                                                                                                                                           GENERAL INFORMATION:
APPLICANT: HART, MARY KATE
APPLICANT: HART, MARY KATE
APPLICANT: WILSON, JULIE
AND AND COMPLEMENTARY: DETERMINING
TITLE OF INVENTION: REGIONS BINDING TO EBOLA GLYCOPROTEIN
FILE REPRENCE: ARMY 166
CURRENT APPLICATION NUMBER: US/10/226, 795
CURRENT PILING DATE: 2002-11-18
NUMBER OF SEQ ID NOS: 40
SOFTWARE: PATENTIN VET: 2.1
SEQ ID NO 28
LENGTH: 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           OTHER INFORMATION: Description of Artificial Sequence: Synthetic light OTHER INFORMATION: chain of Mab EGP6D8-1-2 amino acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

New antibodies that bind to human insulin-like growth factor receptor, useful for treatment, prevention and diagnosis of cancers.

claim 1; SEQ ID NO 2; 164pp; French.

The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or epidermal growth factor receptor (EGFR) and/or with

                          these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells, so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of ISPR and/or EGFR. This sequence represents an CDR sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor, useful for treating cancer.

comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino actermining region (CDR) consisting of one of two fully defined 16 amino actermining region (CDR) consisting of one of two fully defined 16 amino cated (ADEATOLH). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of activation of the IGP-IR and/or connected with a anbourmal cativation of the IGP-IR and/or of EGF with EGFR, where the administration of the transduction pathway of the signal mediated by the induces secondary effects connected with inhibition of the insulin creeptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral character, preferably IGF-dependent, especially IGF1 and/or IGF2—

character, preferably IGF-dependent and/or HERZ/neu-dependent and/or EGF-dependent and/or IGF2-dependent in the preparation of a medicament intended for IGF1-and/or IGF2-dependent and/or IGF2-dependent cells. (I) is useful in the preparation of a medicament intended for prevention or for the treatment of portiasis. (I) is useful in preparation of a medicament intended for the specific targeting of a biologically active compound to treatment of portiasis. (I) is useful in preparation of a medicament intended for IN vitro diagnosis of illnesses induced by an expression or an underexpression of the prevention of the prevention of searting from a biological sample in which involves contacting the center is used in the exemplification of the invention.

Is and/or IN vitro d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                       The cDNAs that encode the anti-XC-4 murine immunoglobulin VH and VL were prepared by PCR from polyadenylated RNA isolated from 100 million KC-4 hybridoma calls. All clones were obtd. from independent PCRs. The sequences of the primers are given in AA087519-087526. The PCR products were cloned, without prior purificn., into pCR1000 (Invitrogen) and sequences in both directions. The VL DNA sequence and its derived protein sequences are shown in AA087531 and AAR70449-R70457. The mature VL chain begins at AA D of framework i (FR1). VL is a group II kappa chain. Part of the CDR3 and all of the FR4 are encoded by JK2. There is a an asparagine glycosylation site in the light chain in FR3. The site reads NIS. (Updated on 25-MAR-2003 to correct PM field.) 셤 8

The present invention describes the use of a polypeptide (I) in the manufacture of a medicament for stimulating a cytotoxic T cell response, where (I) comprises a first portion comprising the part of human Fc that binds to CD64 and a second portion comprising one or more heterologous T.

Example 11; Page 45; 87pp; English.

ö
cell epitopes. Also described is a method of stimulating a cytotoxic T cell response in a patient such as a mammal, preferably human, by administering (1) to the patient. (1) has cytostatic activity and can be used in vaccine production. (1) and the nucleic acid encoding (1) are useful in the manufacture of a medicament for stimulating cytotoxic T cell response. The medicament is useful for preventing and/or treating endicament eigencest, e.g. colorectal, lung, breast, gastric or ovarian cancer. The medicament stimulates cytotoxic and helper T cell responses. The antibodies are useful as vaccines to stimulate helper and cytotoxic T cell responses. The polypeptides and nucleic acids are useful in optimising immunisation schedules for enhancing a protective immune response against cancer. The present sequence represents an Fv region SC100 antibody CDR-L1 amino acid sequence which is used in an example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cytostatic; antitumour; antibody; colon specific antigen-p mucin; hapten binding site; immunoconjugate; close-range lesion; tumour; ovary; thymus; parathyvoid; spleen; carcinoma; gastrointestinal cancer; colorectal cancer; pancer; parcetic cancer; ovarian cancer; complementarity determining region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a multivalent, multispecific antibody or its fragment comprising one more antigen binding sites having affinity towards colon specific antigen-p mucin (CSAp) target antigen and one or more hapten binding sites having affinity towards hapten molecules. The antibody is useful for screening a targetable conjugate. A therapeutic immunoconjugate comprising the antibody is useful for detecting closerange lesion. The antibody or immunoconjugate are also useful for delivering a diagnostic/detection or therapeutic agent, or their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel multivalent, multispecific antibody for detecting/treating tumors expressing colon specific antigen-p mucin in mammal, comprises antigen and hapten binding sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

combination, to a target. The antibody or a targetable conjugate are useful for detecting or treating tumours expressing CSAp in a mammal, for imaging malignant tissue or normal tissue or calls in a mammal expressing CSAp, where the normal tissue is from ovary, thymus, parathyroid or spleen, for intraoperatively identifying/disclosing the diseased tissues expressing CSAp in a subject, and for endoscopic identification of diseased tissues expressing CSAp. They are also useful for intravascular identification of diseased tissues expressing CSAp, for detecting lesions during an endoscopic, laparoscopic, intravascular catheter or surgical procedure, and for detecting and treating target calls, tissues or pathogens in a mammal. A method using the antibody is useful for diagnosing or detecting a malignancy in a subject, where the malignancy is carcinoma, gastrointestinal cancer, colorectal or pancreatic cancer or ovarian cancer, the subject is human or a domestic pet. This sequence represents the light chain complementarity determining region I (CDRI) from the antibodies of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   96.3%; Score 78; DB 7; Length 16; 93.8%; Pred. New cryptic collagen antibody with one or more complementarity determining regions, useful for diagnosing and treating disorders associated with angiogenesis, tumor growth and/or cancer metastasis.

The invention relates to a novel anti-osteopontin antibody or antibody fragment which inhibits the binding of and integrin recognising the RGD sequence to osteopontin (OPN) or its fragment and inhibits the binding of an integrin recognising the SVVGLR sequence to osteopontin or its fragment. An antibody of the invention has immunosuppressive, antiarthritic, anti-rheumatic, and osteopathic activity. The antibodies are useful in diagnostics and developing drugs for autoimmune diseases, rheumatism, rheumatoid arthritis and archritis deformans. With these antibodies, it is possible to distinguish rheumatoid arthritis from arthritis deformans. The present sequence is used in the exemplification

of the invention

Sequence 16 AA;

Claim 25; SEQ ID NO 32; 232pp; English.

This invention relates to a novel grafted antibody or its functional fragment comprising one or more complementarity determining regions (CDRs) of a defined light CDR and a heavy CDR with at least one amino acid (aa) substitution where the antibody has specific binding activity

```
ö
for a cryptic collagen epitope. The growth of all solid tumours requires new blood vessel growth, angiogenesis, inhibition of which is an approach to limiting tumour growth. The invention may allow development of antagonist which a cytostatic activity as a collagen agonist or antagonist. The invention is useful for diagnosing and treating disorders associated with angiogenesis, tumour growth and/or cancer metastasis. The present sequence is the partial amino acid sequence of a mouse anti-orryptic collagen site antibody Hu177 variable region light chain CDR which is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant anti-osteopontin antibodies with human-origin heavy and light chain constant regions, useful in diagnostics and developing drugs for autoimmune diseases, rheumatism and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         osteopontin; antibody; integrin; OPN; immunosuppressive; anti-arthritic; anti-rheumatic; osteopathic; autoimmune disease; rheumatism; rheumatoid arthritis; arthritis deformans; mouse; 2K1; CDR1.

The invention relates to a novel monoclonal antibody specific to adenylate kinase isozyme 3, comprising 4 or more of 6 complementarity determining regions (CDRs) of a sequence having 6-18 amino acids. The invention further relates to: a composition comprising the monoclonal antibody for detecting a heart disease marker AK3; a kit comprising the monoclonal antibody for the diagnosis of heart disease; and a method of detecting a heart disease marker AK3. The for preparing a composition for detecting a heart disease marker AK3. The monoclonal antibody medices false positive results of the conventional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New monoclonal antibody specific to human mitochondrial adenylate kinase isozyme 3, useful for preparing a composition for detecting a heart disease marker AK3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    biochemical markers. This sequence represents a human antibody variable light chain CDR peptide region of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         monoclonal antibody, adenylate kinase isozyme 3; complementarity determining region; CDR; heart disease; marker AK3; biochemical; human; variable; light chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     glycoprotein. The antibodies are ECP6D8-1-1, EGP1376-1-2, and EGP13C6-1-1. The monoclonal antibodies of the invention are useful for treating or ameliorating an Ebola virus infection. The antibodies were found to be effective when administered 2 days after challenge, after significant viral replication had occurred. ADL27487-ADL27489 represent complementarity determining regions (CDRs) from the light chain of a monoclonal antibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated monoclonal antibody that binds Ebola virus GP, which monoclonal antibody comprises a heavy chain variable region, useful for treating or ameliorating Ebola virus infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes monoclonal antibodies that bind Ebola virus
